A+ Gold Traders Panel

BETA USER GUIDE

Welcome

Thank you for taking part in the beta testing of the A+ Gold Traders Panel. This software has been designed to simplify trade execution while incorporating account protection features intended to help prevent excessive trading risk. During beta testing, your feedback on usability, functionality and reliability is extremely valuable.

Trading Panel Overview

The Trading Panel allows rapid execution and management of market and pending orders directly from the chart with in-built user account protections. When loaded, the A+ Traders Panel will connect directly with your account through your Broker . Once connected the panel reads your account balance an automatically sets a Max Draw Down loss limit of 25% and a Risk per trade of 2%. The Stop Loss has a default setting of 100 pips which can be changed accordingly to your desired setting. A Pre-set a Lot Size, TP and SL will automatically be added to every trade entry as they are executed. Once a live trade(s) is running adjustments can be made to the TP & SL dynamically and clicking the Modify buttons will apply the changes to ALL running trades accordingly. The panel also has a manually adjusted trailing Stop Loss. Before placing trades, ensure your desired Lot Size, Stop Loss and Take Profit values have been entered.

Panel Controls

LOT

Sets the trade volume that will be used when placing new market or pending orders. When set, the lot size will be applied to each entry, or can be changed between entries prior to the entry being placed. Exceeding the Max Lot Size = figure shown will initiate a warning message and lock the panel until the lot size is reduced to within limits.

TP (Take Profit)

Sets the Take Profit distance or value used when opening new trades. When set the same lot size will be applied to each entry, or can be changed between trade entries to apply a different pre-entry lot size. A value of 0 means no Take Profit will be applied automatically.

SL (Stop Loss)

Sets the Stop Loss distance or value used when opening new trades. An initial default value of 100 pipis is set. The setting will be applied to all entries or can be changed per entry. Here's the clever part! A TRAILING STOP LOSS. For all live entries, the SL can be reduced/trailed from the initial setting(s), (up for a sell and down for a buy), back towards their respective entry price by setting the SL value to 10 pips and clicking the Modify SL button. Each click will trail the SL value of each entry by 10 pips to their entry price. Once an entry reaches it's break even price (entry point) and that entry moves into profit by more than 10 pips, continuing to click the Modify SL button will trail the SL into the profit side. Any entries that are still in draw down will continue to be trailed towards their entry price and into the profit side accordingly. If the trade is running well, clicking the SL BREAKEVEN button snaps all entries that are in profit to their respective entry price. Any entries in draw down will be ignored.

A Stop Loss should always be used unless your own trading strategy specifically requires

otherwise.

PART

Specifies the lot size that will be closed when using the Take Partial function.

BUY

Opens an immediate Buy (Long) market position using the current panel settings.

SELL

Opens an immediate Sell (Short) market position using the current panel settings.

Close Buys

Immediately closes all currently open Buy positions whether they are in profit or draw down.

Close Sells

Immediately closes all currently open Sell positions whether they are in profit or draw down.

Modify TP

Updates the Take Profit level on all applicable open trades to the value currently entered in the TP field.

Modify SL

Updates the Stop Loss level on all applicable open trades to the value currently entered in the SL field.

CLOSE ALL

Immediately closes every open position(s) whether they are in profit or draw down.

Use with care.

SL BRKEVEN

Moves the Stop Loss on qualifying open trades to the trade entry price (Break Even), helping to remove further downside risk once a trade has moved into profit.

Pend Buy

Places a Buy Pending Order using the current Lot Size, Stop Loss and Take Profit settings.

Pend Sell

Places a Sell Pending Order using the current Lot Size, Stop Loss and Take Profit settings.

Delete All Pendings

Deletes all unexecuted pending orders.

PROFIT & LOSS windows

Displays the total of all entries in profit and a total of all entries in draw down. This provides a very quick visual reference if you are in overall profit or overall loss, enabling a quick decision to be made whether to click the CLOSE ALL button or not should a trade turn against you.

Account Protection

The A+ Gold Traders Panel incorporates a built-in account protection system designed to encourage disciplined risk management. If a trade exceeds the configured account protection limits, the panel will prevent the order from being placed and display an explanatory warning message. These protection features are intended to prevent excessive position sizing or over-exposure to the market, emotional trading and revenge trading before any financial risk is taken. If the Max Entries setting = 1, then only one entry will be permitted, and once placed a message panel will cover the Buy/Sell buttons preventing any more entries until the running entry is closed bringing you back within the account protection limits. To increase the number of allowed entries you must either reduce the lot size and/or the SL values.

Max Lot Size

The Max Lot Size displayed on the panel is the largest trade size currently permitted by the account protection system. This value is calculated automatically from the account protection settings and account balance. If your selected Lot Size exceeds this value, the trade will be rejected until the Lot Size is reduced.

Max Entries

The Max Entries value indicates the maximum number of individual trade entries currently permitted under the account protection rules. If this limit is reached while trading, the panel temporarily disables further Buy and Sell entries until sufficient positions have been closed. This feature helps prevent accidental over-exposure during periods of rapid trading.

Important Information

The A+ Gold Traders Panel is designed to assist trade execution and promote disciplined risk management.

It does not provide trading advice or guarantee profitable results.

Trading leveraged financial products carries significant risk. Always ensure you fully understand

the risks involved and never trade with money you cannot afford to lose. Thank you for participating in the A+ Gold Traders Panel Beta Programme. Please make detailed notes of anything you fined that doesn't work as described, or an bugs you may discover during the use of the panel. For ease of use/testing the Risk Configuration Panel access has been prevented. Your comments and suggestions are greatly appreciated and will help shape future releases. I sincerely hope you find the A+ Traders Panel makes executing and managing your trades much easier .
